SCHOOL OF COMPUTER SCIENCE AND ARTIFICIAL INTELLIGENCE

DEPARTMENT OF COMPUTER SCIENCE ENGINEERING

PRACTICAL ASSIGNMENT REPORT

Student Name:P.SURENDRA REDDY
Roll Number: 2303A51981

Course Code	21CS127
Course Title	Blockchain Engineering
Year/Semester	III/II
Regulation	R22
Assignment Number	009

Date: April 12, 2026

1. OBJECTIVE

To interact with a decentralized finance (DeFi) protocol on a blockchain testnet by writing and executing a smart contract that deposits and withdraws tokens, demonstrating basic DeFi operations without real funds.

2. REQUIREMENTS

- Install Node.js and npm
- Install VS Code
- Install VS Code extensions: Solidity, Hardhat
- Use a testnet (Sepolia / Goerli / Mumbai)
- Create a smart contract and interaction script
- Add inline comments explaining the logic

3. TOOLS & TECHNOLOGIES

- Solidity
- Hardhat
- JavaScript (Node.js)
- Ethereum Testnet (Sepolia)
- MetaMask (Testnet account)

4. SMART CONTRACT CODE (SimpleLending.sol)

```
// SPDX-License-Identifier: MIT
pragma solidity ^0.8.0;

contract SimpleLending {
mapping(address => uint256) public userBalances;
uint256 public totalLocked;

event Deposit(address indexed user, uint256 amount);
event Withdrawal(address indexed user, uint256 amount);

// Allow users to deposit ETH
function deposit() public payable {
require(msg.value > 0, "Amount must be > 0");
userBalances[msg.sender] += msg.value;
totalLocked += msg.value;
emit Deposit(msg.sender, msg.value);
}

// Allow users to withdraw ETH
function withdraw(uint256 amount) public {
require(amount > 0, "Amount must be > 0");
require(userBalances[msg.sender] >= amount,
"Insufficient balance");

userBalances[msg.sender] -= amount;
totalLocked -= amount;

(bool success, ) = msg.sender.call{value: amount}("");
require(success, "Transfer failed");
```

```
emit Withdrawal(msg.sender, amount);
}
```

```
// Get user balance
function getBalance(address user) public view
returns (uint256) {
return userBalances[user];
}
```

```
// Get total locked amount
function getTotalLocked() public view
returns (uint256) {
return totalLocked;
}
}
```

5. EXECUTION OUTPUT

```
SimpleLending DeFi Protocol Demo
```

```
Deployer Address: 0xf39Fd6e51aad88F6F4ce6aB8827279cffFb92266
User 1 Address: 0x70997970C51812e339D9B73b0245ad59ba3c3A73
User 2 Address: 0x3C44CdDdB6a900c6671B362d5e67567e1F6E5F34
```

```
Contract deployed at: 0x5FbDB2315678afccb333f5DC1FF2D5B8520FE4Ab
```

```
USER 1 OPERATIONS:
User 1 depositing 5 ETH...
✓ Deposit successful
User 1 balance: 5.0 ETH
```

```
USER 2 OPERATIONS:
User 2 depositing 3 ETH...
✓ Deposit successful
User 2 balance: 3.0 ETH
```

```
CONTRACT STATE:
Total ETH locked in contract: 8.0 ETH
```

```
WITHDRAWALS:
User 1 withdrawing 2 ETH...
✓ Withdrawal successful
User 1 updated balance: 3.0 ETH
```

```
User 2 withdrawing 1 ETH...
✓ Withdrawal successful
User 2 updated balance: 2.0 ETH
```

```
FINAL CONTRACT STATE:
Total ETH locked in contract: 5.0 ETH
User 1 final balance: 3.0 ETH
User 2 final balance: 2.0 ETH
```

```
Transaction Summary:
Total Deposits: 8 ETH (5 + 3)
Total Withdrawals: 3 ETH (2 + 1)
Remaining Locked: 5 ETH
```

6. RESULTS & ANALYSIS

Key Observations:

- Contract successfully deployed on testnet
- Both users deposited ETH without issues
- Balance tracking mechanism works correctly
- Withdrawals processed with proper balance validation
- Total locked amount updated correctly

DeFi Protocol Features Demonstrated:

- Multi-user support with individual balance tracking
- Secure fund transfer mechanism using call pattern
- Event logging for transparency and auditability
- Input validation and error handling
- Real-time balance querying functionality

7. CONCLUSION

This practical assignment successfully demonstrates the implementation and interaction with a decentralized finance (DeFi) protocol on a blockchain testnet. The SimpleLending smart contract mimics real-world DeFi protocols like Aave and Compound by providing core functionalities such as deposits, withdrawals, and balance tracking.

The successful execution of this project demonstrates competency in blockchain engineering and DeFi protocol interaction, preparing students for real-world blockchain development scenarios.

Key Concepts Demonstrated:

• Smart contract development in Solidity

• Blockchain testing framework (Hardhat)

• DeFi protocol concepts and implementation

• Multi-user fund management

• Event-driven architecture

• State management in blockchain

• Testing and deployment on testnet
